About Riverlane

Riverlane is the world leader in quantum error correction (QEC), the technology that unlocks quantum computing's promise of a new age of human progress.

We partner with over 60% of the world's quantum computer companies and leading high-performance computing (HPC) centres, to solve the error problem blocking their path to 'utility-scale' systems that can transform multiple industries.

[Deltaflow](#), our real-time QEC stack, is interoperable with quantum computers using any qubit modality. It utilises proprietary QEC chips, decoders and compilers. [Deltakit](#), our software platform, helps quantum developers learn, develop and adopt QEC.

Founded in 2016 as a spin-out from Cambridge University, Riverlane is headquartered Cambridge and has offices in Boston and Seattle in the US. The company has over \$120 million in private funding, including an \$85 million Series C round in 2024.

Product offering

Deltaflow - The quantum error correction stack accelerating the world's quantum computers to utility-scale.

Deltaflow delivers real-time error correction to the world's quantum computers. Using our proprietary QEC chip stack and compiler, Deltaflow decodes terabytes of data to enable millions, and ultimately trillions, of reliable quantum operations (QuOps).

Deltakit – The essential toolkit for learning, developing and adopting quantum error correction. Deltakit includes:

Deltakit Textbook – An interactive, hands-on introduction to practical QEC concepts written by Riverlane researchers and contributors. The textbook uses examples, walkthroughs, and code exercises to explain key QEC concepts and help quantum developers gain a thorough understanding of the implementation details of QEC beyond theoretical understanding.

Software Development Kit (SDK) – A Python library for developing and running QEC experiments. The SDK allows users to generate QEC circuits, add realistic noise (i.e. error propagation) based on their QPU's characteristics, simulate QEC execution, decode stabiliser measurement results, and analyse the outcomes. Users can explore different error-correcting codes, circuit depths, and noise models to optimise QEC performance for near-term hardware. The SDK also connects to Riverlane's cloud service, which provides access to high-performance proprietary decoders and supports additional error-correcting codes.

Together, Deltakit and Deltaflow are a holistic QEC platform accelerating the quantum ecosystem to utility-scale.

Facts and Figures (September 2025)
